General Comment

I believe it to be true and logical that a full flowing river would provide cleaner water than a river that has been depleted of its normal flow. Hydrofracking for natural gas is and will continue to extract many more millions of gallons reducing water flow that will in turn allow organic vegetative growth to establish only to be taken down to the Chesapeake when fuller flow returns after rain storms etc. State and Federal regulators need to look at alternatives to so much river water use for hydrofracking eg requiring closed-loop systems etc.
